Title: “Developing Islandscapes: Animals, mobility and environmental practices”

Session organisers: Dr. Lua Valenzuela-Suau and Prof. Richard Madgwick

The social and economic roles of animals in island contexts are exceptionally diverse. However, insular environments share a fundamental structural feature: territories bounded by the sea and therefore characterised by inherently limited resource availability. These conditions make islands particularly sensitive contexts for

examining the relationships between livestock management strategies, landscape transformations, climate change, and interactions between local communities and external contacts.

This session invites contributions that apply zooarchaeological methods (including, but not restricted to isotope analysis, dental microwear, ancient DNA, biometry, or studies of species introductions) to address these issues. The aim is to explore commonalities and differences in subsistence strategies and adaptative mechanisms developed in insular contexts around the world.

The session also seeks to encourage reflection on how these studies can contribute to current debates on climate change and sustainable resource management, highlighting the value of the archaeological record for understanding past decision-making and its relevance to future challenges.

Type of session: Hybrid

Location: Vancouver, Canada (May 17-22, 2027)

Deadline: 25th August

Online submission:
